Payload Assist Module - Delta Class (PAM-D)

September 1979

FOR INFORMATION ONLY
(these data have not been baselined)

National Aeronautics and
Space Administration

Lyndon B. Johnson Space Center
Houston, Texas

PREFACE

This document contains the basic payload data on the Payload Assist Module-Delta Class (PAM-D) and is issued as an annex to the Payload Integration Plan for PAM-D (JSC-14005).

This annex is the single authoritative source for PAM-D payload data of the types designated herein. All data presented in this annex should be considered preliminary. Corrections and updates will be made as necessary with the next planned update publication being made as soon as all data are verified and approved by the Payload Manager and his staff.

Comments and corrections to these data as well as requests for additional data should be directed to E. Dixon Murrah, WC6, NASA-JSC, telephone 713-483-5927.

1.0 Weight and Mass Properties

The major weight elements and sub-elements of the SBS payload for the STS were established for this Annex based on the necessity for presenting sequenced mission mass properties in a logical order of events. The major and sub-elements used for mass properties presentation are as follows:

- A. STS DEPLOYABLE PAYLOAD
 - A.B. EXPENDABLE PAM VEHICLE
- B. PAM AIRBORNE SUPPORT EQUIPMENT
 - B.A. CRADLE
 - B.B. SPINTABLE

This report excludes all spacecraft and spacecraft airborne support equipment mass properties.

The propellant load for the PAM-D motor assumes a 2313 pound spacecraft will be used.

The STS Orbiter-related sequence of events analyzed and presented is as follows:

1. SBS/PAM-D mission mass properties at STS liftoff - sunshield open
2. SBS/PAM-D undeployed-sunshield closed
3. PAM-D ASE-vehicle deployed-sunshield closed
4. PAM-D ASE landing configuration-vehicle deployed - sunshield open

1.1 Mass Properties Coordinate System

The PAM-D mass properties coordinate system is shown in Figure 1. The subscript "KF" is used to identify this system. The letters "KF" are also used as a coordinate code and are displayed on the computer printouts. Note that the $Y_{KF} Z_{KF}$ plane and the $X_{KF} Z_{KF}$ plane pass through the center of the keel trunnion. The Z_{KF} origin is the same as the Orbiter Z-axis origin.

1.1.2 Percentage Weight Classification

The weight classifications for the PAM-D are identified as estimated, calculated, and actual. The following table defines the weight and percent weight class for the PAM-D sub-elements.

<u>Element</u>	PIP CONTROL WEIGHT (POUNDS)	Total Weight (Pounds)	Percent of Total Weight		
			<u>Est</u>	<u>Calc</u>	<u>Act</u>
EXPENDABLE PAM VEHICLE	4918*	4,217	10	90	0
SPINTABLE	} 2244*	293	10	90	0
CRADLE		1,953	15	85	0
TOTAL	7162	6463			

1.2 Sequenced Mass Properties

The STS-related mission mass properties are given in Tables 1 , 2, 3, and 4. The Mass Properties at STS Liftoff can also be used for abort mission landing mode.

1.3 Potential Mass Properties Changes

There are no significant potential mass properties changes identified at this time.

* BASED ON AN SBS TYPE SPACECRAFT AND DOES INCLUDE THE 11 POUNDS OF CROSSOVER ELECTRICAL HARNESS WHICH IS CHARGED TO THE PAM-D.

2.0 RF RADIATION DATA

Two minutes prior to deployment, the PAM-D S-Band transmitter will be activated. After deployment, the RF link will be established with the orbiter payload interrogator.

2.1 PAM-D Transmitting System

Transmitter System Name -- PAM Telemetry Transmitter

Type -- Phase Modulated

Center Frequency -- 2237.5 MHz

Deviation -- ± 1 Radian

Modulation Frequency -- 1.024 MHz Subcarrier

Output -- 8.5 watts min, 14 watts max.

Number of Antennas -- One

Cable Loss, Transmitter to Antenna -- 1.0 dB

2.2 PAM-D RECEIVING SYSTEM - N/A

2.3 PAM-D Antenna System

Antenna System Name -- PAM Telemetry Antenna

Antenna Location -- Fifty-five inch diameter belt around PAM-D motor axis, located 24 inches aft of S/C separation plane.

Associated Antennas -- None

Antenna Gain on Boresight -- -11 dbic -- essentially omni-directional distribution

Antenna Field Polarization -- Linear

Antenna Effective Diameter -- not applicable to omni-antennas

Antenna Pointing from the Radial in Degrees of Elevation and Azimuth -- TBD

Antenna Efficiency -- TBD

Antenna Radiation Distribution Plot -- TBD (Coverage is nominally in the solid angle from 45 to 150 degrees measured from the spacecraft fwd spin axis.)

Transmitter Turn-On -- Two minutes prior to deployment until end of PAM-D mission (battery depletion).

3.0 PAYLOAD PHYSICAL FUNCTION DATA

The SBS utilizes a SSUS-D, which includes a solid rocket motor, to provide the necessary perigee impulse to place the spacecraft into its transfer orbit from the low altitude parking orbit of the Orbiter (160 miles with a 28.5 degree inclination). The SSUS-D is spin stabilized during perigee injection; the spin-up being done while SSUS-D is still attached to and pointed by the Orbiter.

3.1 Payload Deployment and Retrieval System (PDRS) Translation

Requirement - N.A.

3.2 Spun-Up Payload

Type of spin mechanism-Redundant electric motors

Location of spin mechanism and where torque will be applied to
payload-Aft end of SSUS-D (*SEE FIGURE TBD*)

Expected torque to be applied-Less than 1 radian/sec² to the
3712 attach fitting at base of spacecraft

Duration of torque-52-67 seconds

Spin velocity - 50 to 65 rpm \pm 10%

Spin duration - minutes (approximately)

Orientation of axis about which the torque is applied:

parallel to Z axis

TORQUE TIME HISTORY (TBD)

3.3 *SEPARATION MECHANISM (TBD)*
